

STUDENT GRADE PREDICTOR

Abstract

The Student Grade Predictor is a machine learning project that predicts student grades based on study hours and attendance records. The project helps educational institutions identify academic performance trends.

Objective

- Predict student grades.
- Analyze the impact of attendance and study hours.
- Build a machine learning model.
- Improve academic performance analysis.

Tools and Technologies

- Python
- Pandas
- Scikit-Learn
- Matplotlib

Methodology

- Collected student academic data.
- Preprocessed the dataset.
- Selected study hours and attendance as input features.
- Trained a Linear Regression model.
- Evaluated prediction accuracy.
- Visualized relationships between variables.

Results

- Successfully trained the prediction model.
- Predicted student grades accurately.
- Visualized academic trends.
- Evaluated model performance using error metrics.

Conclusion

The project demonstrates how machine learning can assist educational institutions in predicting academic performance and identifying areas for improvement.
